

Coova-Chilli_1.3.0_20141128_HHLB

The default Coova-Chilli on [LEDE 17.01](#) is the [1.3.0+20141128](#).

This version doesn't expose all of its compile options.

Layout

Under the `feeds/packages/net/coova-chilli` directory is the `Makefile`, `Config.in`, `patches` and `files` directories specific to your OpenWRT/LEDE coova-chilli build target platform.

This directory is also referenced as a symbolic link in `package/feeds/packages/coova-chilli`.

Makefile

Open the `package/feeds/packages/coova-chilli/Makefile`:

endef

define Package/coova-chilli/description
```

CoovaChilli is an open source access controller for wireless LAN access points and is based on ChilliSpot. It is used for authenticating users of a wireless (or wired) LAN. It supports web based login (UAM) which is today's standard for public HotSpots and it supports Wireless Protected Access (WPA) which is the standard of the future. Authentication, authorization and accounting (AAA) is handled by your favorite radius server.

  TITLE:=Wireless LAN HotSpot controller (Coova Chilli Version)
```

```

URL:=http://www.coova.org/CoovaChilli
MENU:=1
endif

define Package/coova-chilli/description
    CoovaChilli is an open source access controller for wireless LAN
    access points and is based on ChilliSpot. It is used for authenticating
    users of a wireless (or wired) LAN. It supports web based login (UAM)
    which is today's standard for public HotSpots and it supports Wireless
    Protected Access (WPA) which is the standard of the future.
    Authentication, authorization and accounting (AAA) is handled by your
    favorite radius server.

option "moddir" - "Directory for dynamically loaded modules" string no
option "module" - "Dynamically loaded module" string no multiple

option "dhcport" - "Set a DHCP option using a hex string" string no multiple

option "extadmvsas" - "Extended administrative-user VSA script support" string no multiple

option "dhcportidle" - "DHCP counted for preventing idle-timeout" flag off

option "forcedns1" - "Force all DNS to a specific address" string no
option "forcedns1port" - "Force all DNS to a specific port" int default="0" no

option "forcedns2" - "Force all secondary DNS to a specific address" string no
option "forcedns2port" - "Force all secondary DNS to a specific port" int default="0" no

option "ipv6" - "Enable IPv6 support" flag off
option "ipv6mode" - "IPv6 mode is either 6and4 (default), 4to6, or 6to4" string no
option "ipv6only" - "Enable IPv6-Only" flag off

```

Check the boolean settings section in *package/feeds/packages/coova-chilli/files/chilli.init* with the content of the previous file.

All the variables with the mention **flag on** or **flag off** match the boolean settings section.

```

option "dhcpcbroadcast" - "Always broadcast DHCP responses" flag off
option "dynip" - "Dynamic IP address pool" string no
option "nodynip" - "No Dynamic IP assignment" flag off

```

dhcpcbroadcast and **nodynip** are attributes of boolean settings while **dynip** is not.

Here is the *chilli.init* who matches the *coova-chilli-1.3.0+20141128*:

```

#!/bin/sh /etc/rc.common

START=30
STOP=90

config_cb() {
    chilli_inst=$2
    if [ "$chilli_inst" != "" ]
    then
